

Lab Goal : This lab was designed to teach you more about linked lists. Copy your `SinglyLinkedList` class from the last lab into this folder. You will refactor all classes so they use Generics to specify what type of object the linked list will store.

Lab Description :

In this implementation you will store a reference to both the head and tail of the list in instance variables.

Sample Data :

See the main of `lab15d`.

Sample Output :

```
Original list values:  go on at 34 2.1 -a-2-1 up over
                      num nodes = 8
```

```
List values after calling nodeCount:  go on at 34 2.1 -a-2-1 up over
```

```
List values after calling doubleFirst:  go go on at 34 2.1 -a-2-1 up over
```

```
List values after calling doubleLast:   go go on at 34 2.1 -a-2-1 up over over
```

```
List values after calling skipEveryOther:  go on 34 -a-2-1 over
```

```
List values after calling removeXthNode(2):  go 34 over
```

```
List values after calling setXthNode(2,one):  go one over
```

```
List values after calling removeXthNode(1):
```
